NEWS RELEASE

April 19, 2006

More Discoveries of High-Grade Gold in Quartz Veins and Shear-Veins on Windarra's Pukaskwa Property

Windarra Minerals Ltd. is pleased to report that several new high-grade veins and shear veins were discovered on its Pukaskwa Property in the late fall of 2005, in a short prospecting program undertaken at the end of its grid soil-sampling program (see News Release dated April 5, 2006). While a number of new vein occurrences were discovered within the area of the soil grid, including those yielding high-grade values of 2.4, 1.65, 0.68, 0.64, 0.41, and 0.19 oz/ton gold (80.5, 56.5, 23.2, 21.8, 13.9, and 6.7 g/t, respectively), what is considered to be the most significant discovery was a shear-vein system, the Middle Finger Lake zone, in which samples from a three metre thick zone of sheared metavolcanic rocks containing semi-massive arsenopyrite and subordinate quartz stringer veins, ran 0.47 and 0.25 oz/ton gold (15.9 and 8.6 g/t, respectively). This broad mineralized zone, like the many high-grade vein occurrences outcropping in the surrounding area, is central to the most extensive of a number of east-northeast to northeast trending multi-element soil geochemical anomalies on this part of the property (see attached figure). Another of these anomalies, approximately 500 metres to the southwest, hosts the previously reported bonanza-grade quartz vein discovery, which returned assays of 115.4, 25.3, 4.1 and 0.95 oz/ton gold (3955.1, 869.7, 141.4, and 32.5 g/t, respectively; see News Release dated July 25, 2005).

Windarra is now planning a summer field program on the Pukaskwa property. This work will include follow-up prospecting, trenching and stripping, ground geophysical (Induced Polarization) surveys, and geologic mapping. If results warrant, the work will be followed by a diamond drilling program.

The Pukaskwa property is located 50 kilometres west of Wawa, Ontario, less than 20 km northwest of River Gold Ltd.'s Eagle River Mine, which has produced approximately 600,000 ounces gold since 1995. The property, which consists of a belt of 55 contiguous unpatented mining claims of over 13 km in length, also lies 20 km southwest of the formerly-producing Magnacon mine, in which Windarra and its 72% held subsidiary, Westward Explorations Ltd., hold an interest (25%) jointly with River Gold (75%). Like the Pukaskwa property, the Magnacon properties lie along the highly prospective Mishibishu gold belt.

Windarra Minerals Ltd. can earn a 100% interest in the Pukaskwa Property from Messina Minerals Inc. by issuing 350,000 shares over a 30-month period and by maintaining the property in good standing.

Page two

Geochemical analyses for samples collected during this prospecting program were determined by Accurassay Laboratories of Thunder Bay, Ontario, via fire assay of a 30 gram sample with an atomic absorption finish by an accredited method. Duplicate analyses of samples, with both high and low grades, yielded results within several percent of one another.
